GB/T 7714 BIBT_FX style

Zeping Lee*

2022/10/03 v2.1.5

摘要

The gbt7714 package provides a BibT_EX implementation for the China's national bibliography style standard GB/T 7714. It consists of .bst files for numeric and author-date styles as well as a Latex package which provides the citation style defined in the standard. It is compatible with natbib and supports language detection (Chinese and English) for each biblilography entry.

1 简介

GB/T 7714—2015 《信息与文献 参考文献著录规则》^[1] (以下简称"国标")是中国的参考文献格式推荐标准。国内的绝大部分学术期刊、学位论文都使用了基于该标准的格式。本宏包是国标的 BibT_EX^[2] 实现,具有以下特性:

- 兼容 natbib 宏包^[3]。
- 支持"顺序编码制"和"著者-出版年制"两种风格。
- 自动识别语言并进行相应处理。
- 提供了简单的接口供用户修改样式。
- 同时提供了 2005 版的 .bst 文件。

本宏包的主页: https://github.com/zepinglee/gbt7714-bibtex-style。

2 版本 v2.0 的重要修改

从 v2.0 版本开始(2020-03-04),用户必须在文档中使用 \biblilographystyle 命令选择参考文献样式,如 gbt7714-numerical 或 gbt7714-author-year。在早期的版本中,选择文献样式的方法是将 numbers 或 super 等参数传递给 gbt7714,而不能使用 \bibliographystyle。这跟标准的 LaTeX 接口不一致,所以将被弃用。

^{*}zepinglee AT gmail.com

3 使用方法

以下是 gbt7714 宏包的一个简单示例。

```
\documentclass{ctexart}
\usepackage{gbt7714}
\bibliographystyle{gbt7714-numerical}
\begin{document}
    \cite{...}
    ...
    \bibliography{bibfile}
\end{document}
```

按照国标的规定,参考文献的标注体系分为"顺序编码制"和"著者-出版年制"。用户应在导言区调用宏包 gbt7714,并且使用 \bibliographystyle 命令选择参考文献表的样式,比如:

\bibliographystyle{gbt7714-numerical} % 顺序编码制

或者

\bibliographystyle{gbt7714-author-year} % 著者-出版年制

此外还可以使用 2005 版的格式 gbt7714-2005-numerical 和 gbt7714-2005-autho r-year。

注意,版本 v2.0 更改了设置参考文献表样式的方法,要求直接使用 \bibliographystyle,不再使用宏包的参数,而且更改了 bst 的文件名。

\citestyle \citestyle{\langle citation style \rangle}

可选: super, numbers, author-year。使用 \bibliography 选择参考文献表的样式时会自动设置对应的引用样式。顺序编码制的引用标注默认使用角标式(super),如"张三^[2] 提出"。如果要使用正文模式,如"文献 [3] 中说明",可以使用 \citestyle 命令切换为数字式(numbers)。

\citestyle{numbers}

著者-出版年制通常不需要修改引用样式。

sort&compress (*env.*)

同一处引用多篇文献时,应当将各篇文献的 key 一同写在 \cite 命令中。如遇连续编号,默认会自动转为起讫序号并用短横线连接(见 natbib 的 compress 选项)。如果要对引用的编号进行自动排序,需要在调用 gbt7714 时加 sort&compress 参数,这些参数会传给 natbib 处理。

\usepackage[sort&compress]{gbt7714}

注意国标中要求 2 个或以上的连续编号用连接号,不同于 natbib 默认的 3 个或以上。 宏包中已经作了修改。

若需要标出引文的页码,可以标在 \cite 的可选参数中,如 \cite [42] {knuth84}。 更多的引用标注方法可以参考 natbib 宏包的使用说明 $^{[3]}$ 。

使用时需要注意以下几点:

- .bib 数据库应使用 UTF-8 编码。
- 使用著者-出版年制参考文献表时,中文的文献必须 在 key 域填写作者姓名的拼音,才能按照拼音排序,详见第 6 节。

4 文献类型

国标中规定了 16 种参考文献类型,表 1 列举了 bib 数据库中对应的文献类型。这些尽可能兼容 $BibT_{P}X$ 和 biblatex 的标准类型,但是新增了若干文献类型(带 * 号)。

表 1: 全部文献类型

文献类型	标识代码	Entry Type
普通图书	M	book
图书的析出文献	M	incollection
会议录	C	proceedings
会议录的析出文献	C	inproceedings 或 conference
汇编	G	collection*
报纸	N	newspaper*
期刊的析出文献	J	article
学位论文	D	mastersthesis 或 phdthesis
报告	R	techreport
标准	S	standard*
专利	P	patent*
数据库	DB	database*
计算机程序	CP	software*
电子公告	EB	online*
档案	A	archive*
與图	CM	map*
数据集	DS	dataset*
其他	Z	misc

5 著录项目

由于国标中规定的著录项目多于 $BibT_EX$ 的标准域,必须新增一些著录项目(带*号),这些新增的类型在设计时参考了 BibLaTeX,如 date 和 urldate。本宏包支持的全部域如下:

author 主要责任者 title 题名 mark* 文献类型标识 medium* 载体类型标识 translator* 译者 editor 编辑 organization 组织 (用于会议) booktitle 图书题名 series 系列 journal 期刊题名 edition 版本 address 出版地 publisher 出版者 school 学校(用于@phdthesis) **institution** 机构 (用于@techreport) year 出版年 volume 卷 number 期(或者专利号) pages 引文页码 date* 更新或修改日期 urldate* 引用日期 url 获取和访问路径 doi 数字对象唯一标识符 langid* 语言

key 拼音(用于排序)

不支持的 BibT_PX 标准著录项目有 annote, chapter, crossref, month, type。

本宏包默认情况下可以自动识别文献语言,并自动处理文献类型和载体类型标识,但是在少数情况下需要用户手动指定,如:

```
@misc{citekey,
  langid = {japanese},
  mark = {Z},
```

```
medium = {DK},
...
}
```

可选的语言有 english, chinese, japanese, russian。

6 文献列表的排序

国标规定参考文献表采用著者-出版年制组织时,各篇文献首先按文种集中,然后按著者字顺和出版年排列;中文文献可以按著者汉语拼音字顺排列,也可以按著者的笔画笔顺排列。然而由于 BibTeX 功能的局限性,无法自动获取著者姓名的拼音或笔画笔顺,所以必须在 bib 数据库中的 key 域手动录入著者姓名的拼音用于排序,如:

```
@book{capital,
    author = {马克思 and 恩格斯},
    key = {ma3 ke4 si1 & en1 ge2 si1},
    ...
}
```

对于著者-出版年的样式,如果中文文献较多时更推荐使用 biblatex 宏包,其后端 biber 可以自动处理中文按照拼音排序,无须手动填写拼音。

7 自定义样式

BibT_EX 对自定义样式的支持比较有限,所以用户只能通过修改 bst 文件来修改 文献列表的格式。本宏包提供了一些接口供用户更方便地修改。

在 bst 文件开始处的 load.config 函数中,有一组配置参数用来控制样式,表 2 列出了每一项的默认值和功能。若变量被设为 #1 则表示该项被启用,设为 #0 则不启用。默认的值是严格遵循国标的配置。

若用户需要定制更多内容,可以学习 bst 文件的语法并修改[4-6],或者联系作者。

8 相关工作

TeX 社区也有其他关于 GB/T 7714 系列参考文献标准的工作。2005 年吴凯 $^{[7]}$ 发布了基于 GB/T 7714—2005 的 $^{[8]}$ 发术式,支持顺序编码制和著者出版年制两种风格。李志奇 $^{[8]}$ 发布了严格遵循 GB/T 7714—2005 的 $^{[8]}$ 发布了严格遵循 GB/T 7714—2005 的 $^{[8]}$ 发布了严格遵循 $^{[9]}$ 提供

表 2: 参考文献表样式的配置参数

会料 居	ML 11 /击	지수 나가
参数值	默认值	功能
uppercase.name	#1	将著者姓名转为大写
max.num.authors	#3	输出著者的最多数量
year.after.author	#0	年份置于著者之后
period.after.author	#0	著者和年份之间使用句点连接
italic.book.title	#0	西文书籍名使用斜体
sentence.case.title	#1	将西文的题名转为 sentence case
link.title	#0	在题名上添加 url 的超链接
title.in.journal	#1	期刊是否显示标题
show.patent.country	#0	专利题名是否含国别
space.before.mark	#0	文献类型标识前是否有空格
show.mark	#1	显示文献类型标识
show.medium.type	#1	显示载体类型标识
component.part.label	"slash"	表示析出文献的符号,可选: "in", "none"
italic.journal	#0	西文期刊名使用斜体
show.missing.address.publisher	#0	出版项缺失时显示"出版者不详"
space.before.pages	#1	页码与前面的冒号之间有空格
only.start.page	#0	只显示起始页码
wave.dash.in.pages	#0	起止页码使用波浪号
show.urldate	#1	显示引用日期 urldate
show.url	#1	显示 url
show.doi	#1	显示 DOI
show.preprint	#1	显示预印本信息
show.note	#0	显示 note 域的信息
end.with.period	#1	结尾加句点

了另一个 $BibT_EX$ 实现,还给每行 bst 代码写了 java 语言注释。沈周 $^{[10]}$ 基于 biblatex-caspervector $^{[11]}$ 进行修改,以符合国标的格式。胡振震发布了符合 GB/T 7714—2015 标准的 BibLaTeX 参考文献样式 $^{[12]}$,并进行了比较完善的持续维护。

A 宏包的代码实现

兼容过时的接口

```
₁ ⟨*package⟩
2 \newif\ifgbt@legacy@interface
3 \newif\ifgbt@mmxv
4 \newif\ifgbt@numerical
5 \newif\ifgbt@super
6 \newcommand\gbt@obsolete@option[1]{%
    \PackageWarning{gbt7714}{The option "#1" is obsolete}%
8 }
 \DeclareOption{2015}{%
    \gbt@obsolete@option{2015}%
    \gbt@legacy@interfacetrue
11
    \gbt@mmxvtrue
12
14 \DeclareOption{2005}{%
    \gbt@obsolete@option{2005}%
    \gbt@legacy@interfacetrue
    \gbt@mmxvfalse
18 }
  \DeclareOption{super}{%
    \gbt@obsolete@option{super}%
    \gbt@legacy@interfacetrue
    \gbt@numericaltrue
    \gbt@supertrue
23
24 }
  \DeclareOption{numbers}{%
    \gbt@obsolete@option{numbers}%
    \gbt@legacy@interfacetrue
27
    \gbt@numericaltrue
    \gbt@superfalse
30 }
  \DeclareOption{authoryear}{%
    \gbt@obsolete@option{authoryear}%
    \gbt@legacy@interfacetrue
    \qbt@numericalfalse
34
   将选项传递给 natbib
36 \DeclareOption*{\PassOptionsToPackage{\CurrentOption}{natbib}}
37 \ProcessOptions\relax
```

调用宏包,注意只需要 compress 不需要 sort。

- 38 \RequirePackage{natbib}
- 39 \RequirePackage{url}

如果将 compress 传给 natbib 容易导致 option clash。这里直接修改内部命令。

- 40 \def\NAT@cmprs{\@ne}
- \citestyle 定义接口切换引用文献的标注法,可用 \citestyle 调用 numerical 或 authoryear, 参见 natbib。
 - 41 \renewcommand\newblock{\space}
 - 42 \newcommand\bibstyle@super{\bibpunct{[]}{,}{s}{,}{,}}
 - 43 \newcommand\bibstyle@numbers{\bibpunct{[]}{,}{n}{,}}
 - 44 \newcommand\bibstyle@authoryear{\bibpunct{(){})}{;}{a}{,}}
 - 45 \newcommand\bibstyle@inline{\bibstyle@numbers}

(End definition for \citestyle. This function is documented on page 2.)

在使用 \bibliographystyle 时自动切换引用文献的标注的样式。

- 46 \@namedef{bibstyle@gbt7714-numerical}{\bibstyle@super}
- 47 \@namedef{bibstyle@gbt7714-author-year}{\bibstyle@authoryear}
- 48 \@namedef{bibstyle@gbt7714-2005-numerical}{\bibstyle@super}
- 49 \@namedef{bibstyle@gbt7714-2005-author-year}{\bibstyle@authoryear}
- \cite 下面修改 natbib 的引用格式。为了减少依赖的宏包,这里直接重定义命令不使用 etoolbox 的 \patchcmd。

Super 样式的 \citep 的页码也为上标。另外加上 \kern\p@ 去掉上标式引用后与中文之间多余的空格、参考 tuna/thuthesis#624。

- 50 \renewcommand\NAT@citesuper[3]{%
- 51 \ifNAT@swa
- 52 \if*#2*\else
- 53 #2\NAT@spacechar
- 54 **\f**j
- % \unskip\kern\p@\NAT@@open#1\NAT@@close%
- % \if*#3*\else\NAT@spacechar#3\fi\else #1\fi\endgroup}
- 57 \unskip\kern\p@
- 58 %
- 59 \NAT@@open
- 60 #1%
- 61 \NAT@@close
- 62 \if*#3*\else
- 63 #3%
- 64 \fi
- 65 %
- 66 \kern\p@

```
\else
     #1%
68
   \fi
   \endgroup
71 }
   将 numbers 样式的 \citep 的页码置于括号外。
72 \renewcommand\NAT@citenum[3]{%
   \ifNAT@swa
     \NAT@@open
     \if*#2*\else
      #2\NAT@spacechar
     \fi
     % #1\if*#3*\else\NAT@cmt#3\fi\NAT@close\else#1\fi\endgroup}
     #1\NAT@@close
     \if*#3*\else
      \textsuperscript{#3}%
     \fi
82
   \else
     #1%
   \fi
85
   \endgroup
86
87 }
   Numerical 模式的 \citet 的页码:
88 \def\NAT@citexnum[#1][#2]#3{%
   \NAT@reset@parser
   \NAT@sort@cites{#3}%
90
   \NAT@reset@citea
   92
     \@for\@citeb:=\NAT@cite@list\do
93
     {\@safe@activestrue
      \edef\@citeb{\expandafter\@firstofone\@citeb\@empty}%
      \@safe@activesfalse
96
      \@ifundefined{b@\@citeb\@extra@b@citeb}{%
       {\reset@font\bfseries?}
        {Citation `\@citeb' on page \thepage \space undefined}}%
100
      {\let\NAT@last@num\NAT@num\let\NAT@last@nm\NAT@nm
      \NAT@parse{\@citeb}%
102
      \let\NAT@name=\NAT@all@names
104
```

```
\fi
                                                                            107
                                                                                              \let\NAT@nm\NAT@name\fi
                                                                            \ifNAT@swa
                                                                                    \@citea
 111
                                                                                              }{%
 113
                                                                                              \ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensuremath{\mbox{0}}\ensure
                                                                                                     \NAT@ifcat@num\NAT@num

344
     lang.ja.order
345
     lang.en.order
346
     lang.ru.order
347
     lang.other.order
349 (/author-year)
350 }
351
352 STRINGS {
     component.part.label
353
    下面每个变量若被设为 #1 则启用该项,若被设为 #0 则不启用。默认的值是严
格遵循国标的配置。
356 FUNCTION {load.config}
357 {
    如果姓名的数量大于等于 et.al.min, 只著录前 et.al.use.first 个, 其后加
"et al."或"等"。
358 (*!ucas)
    #2 'citation.et.al.min :=
    #1 'citation.et.al.use.first :=
361 (/!ucas)
362 (*ucas)
    #3 'citation.et.al.min :=
     #1 'citation.et.al.use.first :=
365 (/ucas)
    #4 'bibliography.et.al.min :=
    #3 'bibliography.et.al.use.first :=
367
    英文姓名转为全大写:
368 (*!(no-uppercase | thu))
     #1 'uppercase.name :=
370 </!(no-uppercase | thu)>
371 (*no-uppercase | thu)
     #0 'uppercase.name :=
373 (/no-uppercase | thu)
    使用 TeX 宏输出"和"、"等"
374 (*!(macro | ucas))
    #0 'terms.in.macro :=
376 (/!(macro | ucas))
377 (*macro | ucas)
    #1 'terms.in.macro :=
378
379 (/macro | ucas)
    将年份置于著者后面(著者-出版年制默认)
380 (*numerical | ucas)
     #0 'year.after.author :=
382 (/numerical | ucas)
383 (*author-year&!ucas)
    #1 'year.after.author :=
```

385 (/author-year&!ucas)

```
采用著者-出版年制时,作者姓名与年份之间使用句点连接:
386 (*numerical)
     #1 'period.after.author :=
388 (/numerical)
   ⟨*author-year⟩
   \langle *2015\&!(period \mid ustc) \rangle
     #0 'period.after.author :=
\langle /2015\&!(period \mid ustc) \rangle
   (*period | 2005 | ustc)
     #1 'period.after.author :=
395 (/period | 2005 | ustc)
396 (/author-year)
     书名使用斜体:
397 (*!italic-book-title)
     #0 'italic.book.title :=
   ⟨/!italic-book-title⟩
   ⟨*italic-book-title⟩
     #1 'italic.book.title :=
402 (/italic-book-title)
     英文标题转为 sentence case (句首字母大写,其余小写):
403 (*!no-sentence-case)
     #1 'sentence.case.title :=
405 (/!no-sentence-case)
   ⟨*no-sentence-case⟩
     #0 'sentence.case.title :=
408 (/no-sentence-case)
     在标题添加超链接:
409 (*!link-title)
     #0 'link.title :=
411 </!link-title>
412 (*link-title)
     #1 'link.title :=
414 (/link-title)
     期刊是否含标题:
415 (*!no-title-in-journal)
     #1 'title.in.journal :=
417 </!no-title-in-journal>
   ⟨*no-title-in-journal⟩
     #0 'title.in.journal :=
420 (/no-title-in-journal)

535 }
536
```

B.2 The ENTRY declaration

Like Scribe's (according to pages 231-2 of the April '84 edition), but no fullauthor or editors fields because BibTeX does name handling. The annote field is commented out here because this family doesn't include an annotated bibliography style. And in addition to the fields listed here, BibTeX has a built-in crossref field, explained later.

```
537 ENTRY

These string entry variables are used to form the citation label. In a storage pinch, sort.label can be easily computed on the fly.

```
576 { label extra.label sort.label short.list entry.mark entry.url }
```

B.3 Entry functions

Each entry function starts by calling output.bibitem, to write the \bibitem and its arguments to the .BBL file. Then the various fields are formatted and printed by output or output.check. Those functions handle the writing of separators (commas, periods, \newblock's), taking care not to do so when they are passed a null string. Finally, fin.entry is called to add the final period and finish the entry.

A bibliographic reference is formatted into a number of 'blocks': in the open format, a block begins on a new line and subsequent lines of the block are indented. A block may contain more than one sentence (well, not a grammatical sentence,

but something to be ended with a sentence ending period). The entry functions should call new.block whenever a block other than the first is about to be started. They should call new.sentence whenever a new sentence is to be started. The output functions will ensure that if two new.sentence's occur without any non-null string being output between them then there won't be two periods output. Similarly for two successive new.block's.

The output routines don't write their argument immediately. Instead, by convention, that argument is saved on the stack to be output next time (when we'll know what separator needs to come after it). Meanwhile, the output routine has to pop the pending output off the stack, append any needed separator, and write it.

To tell which separator is needed, we maintain an output.state. It will be one of these values: before all just after the \bibitem mid.sentence in the middle of a sentence: comma needed if more sentence is output after sentence just after a sentence: period needed after.block just after a block (and sentence): period and \newblock needed. Note: These styles don't use after.sentence

VAR: output.state: INTEGER - state variable for output

The output.nonnull function saves its argument (assumed to be nonnull) on the stack, and writes the old saved value followed by any needed separator. The ordering of the tests is decreasing frequency of occurrence.

由于专著中的析出文献需要用到很特殊的"//",所以我又加了一个 after.slash。 其他需要在特定符号后面输出,所以写了一个 output.after。

```
output.nonnull(s) ==
BEGIN
     s := argument on stack
     if output.state = mid.sentence then
         write\$(pop() * ", ")
                -- "pop" isn't a function: just use stack top
     else
         if output.state = after.block then
             write$(add.period$(pop()))
             newline$
             write$("\newblock ")
              if output.state = before.all then
                 write$(pop())
             else -- output.state should be after.sentence
                 write$(add.period$(pop()) * " ")
          fi
          output.state := mid.sentence
      fi
      push s on stack
END
```

The output function calls output.nonnull if its argument is non-empty; its argument may be a missing field (thus, not necessarily a string)

```
output(s) ==
BEGIN
    if not empty$(s) then output.nonnull(s)
    fi
END
```

The output check function is the same as the output function except that, if necessary, output check warns the user that the t field shouldn't be empty (this is because it probably won't be a good reference without the field; the entry functions try to make the formatting look reasonable even when such fields are empty).

```
output.check(s,t) ==
BEGIN
   if empty$(s) then
       warning$("empty " * t * " in " * cite$)
   else output.nonnull(s)
   fi
END
```

The output bibitem function writes the \bibitem for the current entry (the label should already have been set up), and sets up the separator state for the output functions. And, it leaves a string on the stack as per the output convention.

```
output.bibitem ==
BEGIN
     newline$
     write$("\bibitem[")
write$(label)
                            % for alphabetic labels,
     write$(label)
                            % these three lines
     write$("]{")
                            % are used
     write$("\bibitem{")
                                     % this line for numeric labels
     write$(cite$)
     write$("}")
     push "" on stack
     output.state := before.all
END
```

The fin.entry function finishes off an entry by adding a period to the string remaining on the stack. If the state is still before all then nothing was produced for this entry, so the result will look bad, but the user deserves it. (We don't omit the whole entry because the entry was cited, and a bibitem is needed to define the citation label.)

```
fin.entry ==
BEGIN
    write$(add.period$(pop()))
    newline$
END
```

The new.block function prepares for a new block to be output, and new.sentence prepares for a new sentence.

```
new.block ==
BEGIN
    if output.state <> before.all then
        output.state := after.block
    fi
END
```

```
new.sentence ==
BEGIN
    if output.state <> after.block then
        if output.state <> before.all then
            output.state := after.sentence
        fi
    fi
END
```

849
          if$
850
851
     if$
852
853 }
```

Sometimes we begin a new block only if the block will be big enough. The new.block.checka function issues a new.block if its argument is nonempty; new.block.checkb does the same if either of its TWO arguments is nonempty.

```
855 FUNCTION {new.block.checka}
856 { empty$
        'skip$
857
        'new.block
858
     if$
859
860 }
861
862 FUNCTION {new.block.checkb}
863 { empty$
     swap$ empty$
864
     and
865
        'skip$
866
        'new.block
867
     if$
868
869 }
870
```

The new.sentence.check functions are analogous.

```
871 FUNCTION {new.sentence.checka}
872 { empty$
        'skip$
873
        'new.sentence
874
     if$
875
876 }
877
878 FUNCTION {new.sentence.checkb}
879 { emptv$
     swap$ empty$
880
881
       'skip$
        'new.sentence
883
     if$
884
885 }
886
```

B.4 Formatting chunks

Here are some functions for formatting chunks of an entry. By convention they either produce a string that can be followed by a comma or period (using add.period\$, so it is OK to end in a period), or they produce the null string.

A useful utility is the field.or.null function, which checks if the argument is the result of pushing a 'missing' field (one for which no assignment was made when the current entry was read in from the database) or the result of pushing a string having no non-white-space characters. It returns the null string if so, otherwise it returns the field string. Its main (but not only) purpose is to guarantee that what's left on the stack is a string rather than a missing field.

```
field.or.null(s) ==
BEGIN
    if empty$(s) then return ""
    else return s
END
```

Another helper function is emphasize, which returns the argument emphazised, if that is non-empty, otherwise it returns the null string. Italic corrections aren't used, so this function should be used when punctation will follow the result.

```
emphasize(s) ==
BEGIN
   if empty$(s) then return ""
   else return "{\em " * s * "}"
```

The 'pop\$' in this function gets rid of the duplicate 'empty' value and the 'skip\$' returns the duplicate field value

```
887 FUNCTION {field.or.null}
888 { duplicate$ empty$
```

```
{ pop$ "" }
889
        'skip$
890
     if$
891
892 }
893
894 FUNCTION {emphasize}
   { duplicate$ empty$
        { pop$ "" }
896
        { "\emph{" swap$ * "}" * }
897
898
899 }
901 FUNCTION {format.btitle}
   { italic.book.title
     entry.lang lang.en = and
903
        'emphasize
904
        'skip$
905
     if$
907 }
908
```

B.4.2 Format names

The format.names function formats the argument (which should be in BibTeX name format) into First Von Last, Junior, separated by commas and with an and

before the last (but ending with et~al. if the last of multiple authors is others). This function's argument should always contain at least one name.

```
VAR: nameptr, namesleft, numnames: INTEGER
pseudoVAR: nameresult: STRING
                                      (it's what's accumulated on the stack)
format.names(s) ==
BEGIN
     nameptr := 1
     numnames := num.names$(s)
     namesleft := numnames
     while namesleft > 0
                              % for full names:
          t := format.name$(s, nameptr, "{ff~}{vv~}{ll}{, jj}")
                              % for abbreviated first names:
          t := format.name$(s, nameptr, "{f.~}{vv~}{ll}{, jj}")
          if nameptr > 1 then
             if namesleft > 1 then nameresult := nameresult * ", " * t
              else if numnames > 2
                     then nameresult := nameresult * ","
                   fi
                   if t = "others"
                     then nameresult := nameresult * " et~al."
                     else nameresult := nameresult * " and " * t
              fi
          else nameresult := t
          nameptr := nameptr + 1
          namesleft := namesleft - 1
       od
      return nameresult
END
```

The format.authors function returns the result of format.names(author) if the author is present, or else it returns the null string

```
format.authors ==
BEGIN
    if empty$(author) then return ""
    else return format.names(author)
    fi
END
```

Format.editors is like format.authors, but it uses the editor field, and appends , editor or , editors

```
format.editors ==
BEGIN
    if empty$(editor) then return ""
    else
        if num.names$(editor) > 1 then
        return format.names(editor) * ", editors"
```

```
else
    return format.names(editor) * ", editor"
    fi
    fi
END
```

Other formatting functions are similar, so no comment $\,$ version will be given for them.

B.4.3 Format title

The format.title function is used for non-book-like titles. For most styles we convert to lowercase (except for the very first letter, and except for the first one after a colon (followed by whitespace)), and hope the user has brace-surrounded words that need to stay capitilized; for some styles, however, we leave it as it is in the database.

```
1232 { url empty$ not
        { "\href{" url * "}{" * swap$ * "}" * }
1233
        { doi empty$ not
1234

1278 }
1279
```

For several functions we'll need to connect two strings with a tie (~) if the second one isn't very long (fewer than 3 characters). The tie.or.space.connect function does that. It concatenates the two strings on top of the stack, along with either a tie or space between them, and puts this concatenation back onto the stack:

```
tie.or.space.connect(str1,str2) ==
BEGIN
   if text.length$(str2) < 3
      then return the concatenation of str1, "~", and str2
   else return the concatenation of str1, " ", and str2
END</pre>
```

The either.or.check function complains if both fields or an either-or pair are nonempty.

```
either.or.check(t,s) ==
BEGIN
    if empty$(s) then
        warning$(can't use both " * t * " fields in " * cite$)
    fi
END
```

The format.bvolume function is for formatting the volume and perhaps series name of a multivolume work. If both a volume and a series field are there, we assume the series field is the title of the whole multivolume work (the title field should be the title of the thing being referred to), and we add an of <series>. This function is called in mid-sentence.

The format.number.series function is for formatting the series name and perhaps number of a work in a series. This function is similar to format.bvolume, although for this one the series must exist (and the volume must not exist). If the number field is empty we output either the series field unchanged if it exists or else the null string. If both the number and series fields are there we assume the series field gives the name of the whole series (the title field should be the title of the work being one referred to), and we add an in <series>. We capitilize Number when this function is used at the beginning of a block.

B.4.7 Format date

The format.date function is for the month and year, but we give a warning if there's an empty year but the month is there, and we return the empty string if they're both empty.

期刊需要著录起止范围, 其中年份使用"/"分隔, 卷和期使用"-"分隔。版本 v2.0.2 前的年份也使用"-"分隔, 仅提供兼容性, 不再推荐。

```
1667 FUNCTION {extract.before.dash}

```
if$
isia if$
isia }

更新、修改日期只用于电子资源 electronic

isia FUNCTION {format.editdate}
isia { "\allowbreak(" date * ")" * }
if$
isia { "" }
if$
isia { "" }
```

国标中的"引用日期"都是与 URL 同时出现的,所以其实为 urldate,这个虽然不是 BibT_FX 标准的域,但是实际中很常见。

```
1823 FUNCTION {format.urldate}
1824 { show.urldate show.url and entry.url empty$ not and
1825    is.pure.electronic or
1826    urldate empty$ not and
1827    { "\allowbreak[" urldate * "]" * }
1828    { "" }
1829    if$
1830 }
```

B.4.8 Format pages

By default, BibTeX sets the global integer variable global.max\$ to the BibTeX constant glob_str_size, the maximum length of a global string variable. Analogously, BibTeX sets the global integer variable entry.max\$ to ent_str_size, the maximum length of an entry string variable. The style designer may change these if necessary (but this is unlikely)

The n.dashify function makes each single `-' in a string a double `--' if it's not already

```
do
    pageresult := pageresult * "-"
    t := t with the "-" removed
    od
    fi
    else
     pageresult := pageresult * the first character
     t := t with the first character removed
    fi
    od
    return pageresult
END
```

国标里页码范围的连接号使用 hyphen,需要将 dash 转为 hyphen。

```
1832 FUNCTION {hyphenate}
1833 { 't :=
1834
        { t empty$ not }
1835
        { t #1 #1 substring$ "-" =
1836
             { wave.dash.in.pages
1837
                 { "~" * }
1838
                 { "-" * }
               if$
                 { t #1 #1 substring$ "-" = }
1841
                 { t #2 global.max$ substring$ 't := }
1842
               while$
1843
1844
             { t #1 #1 substring$ *
1845
               t #2 global.max$ substring$ 't :=

B.5 Functions for all entry types

Now we define the type functions for all entry types that may appear in the .BIB file—e.g., functions like 'article' and 'book'. These are the routines that actually generate the .BBL-file output for the entry. These must all precede the READ command. In addition, the style designer should have a function 'default.type' for unknown types. Note: The fields (within each list) are listed in order of appearance, except as described for an 'inbook' or a 'proceedings'.

B.5.1 专著

B.6 Common macros

Here are macros for common things that may vary from style to style. Users are encouraged to use these macros.

Months are either written out in full or abbreviated

```
2565 MACRO {jan} {"January"}
2566
2567 MACRO {feb} {"February"}
2568
2569 MACRO {mar} {"March"}
2571 MACRO {apr} {"April"}
2573 MACRO {may} {"May"}
2574
2575 MACRO {jun} {"June"}
2576
2577 MACRO {jul} {"July"}
2579 MACRO {aug} {"August"}
2580
2581 MACRO {sep} {"September"}
2582
2583 MACRO {oct} {"October"}
```

```
2585 MACRO {nov} {"November"}
2586
2587 MACRO {dec} {"December"}
```

2629

Journals are either written out in full or abbreviated; the abbreviations are like those found in ACM publications.

To get a completely different set of abbreviations, it may be best to make a separate .bib file with nothing but those abbreviations; users could then include that file name as the first argument to the \bibliography command

```
2589 MACRO {acmcs} {"ACM Computing Surveys"}
2590
2591 MACRO {acta} {"Acta Informatica"}
2593 MACRO {cacm} {"Communications of the ACM"}
2594
2595 MACRO {ibmjrd} {"IBM Journal of Research and Development"}
2596
2597 MACRO {ibmsj} {"IBM Systems Journal"}
2599 MACRO {ieeese} {"IEEE Transactions on Software Engineering"}
2600
2601 MACRO {ieeetc} {"IEEE Transactions on Computers"}
2602
2603 MACRO {ieeetcad}
    {"IEEE Transactions on Computer-Aided Design of Integrated Circuits"}
2606 MACRO {ipl} {"Information Processing Letters"}
2607
2608 MACRO {jacm} {"Journal of the ACM"}
2609
2610 MACRO {jcss} {"Journal of Computer and System Sciences"}
2612 MACRO {scp} {"Science of Computer Programming"}
2613
2614 MACRO {sicomp} {"SIAM Journal on Computing"}
2615
2616 MACRO {tocs} {"ACM Transactions on Computer Systems"}
2617
2618 MACRO {tods} {"ACM Transactions on Database Systems"}
2620 MACRO {tog} {"ACM Transactions on Graphics"}
2621
2622 MACRO {toms} {"ACM Transactions on Mathematical Software"}
2623
2624 MACRO {toois} {"ACM Transactions on Office Information Systems"}
2626 MACRO {toplas} {"ACM Transactions on Programming Languages and Systems"}
2628 MACRO {tcs} {"Theoretical Computer Science"}
```

B.7 Format labels

The sortify function converts to lower case after purify\$ing; it's used in sorting and in computing alphabetic labels after sorting

The chop.word(w,len,s) function returns either s or, if the first len letters of s equals w (this comparison is done in the third line of the function's definition), it returns that part of s after w.

```
2630 FUNCTION {sortify}
2631 { purify$
2632 "l" change.case$
2633 }
```

We need the chop.word stuff for the dubious unsorted-list-with-labels case.

```
2635 FUNCTION {chop.word}
2636 { 's :=
2637    'len :=
2638    s #1 len substring$ =
2639    { s len #1 + global.max$ substring$ }
2640    's
2641    if$
2642 }
```

The format.lab.names function makes a short label by using the initials of the von and Last parts of the names (but if there are more than four names, (i.e., people) it truncates after three and adds a superscripted +; it also adds such a + if the last of multiple authors is others). If there is only one name, and its von and Last parts combined have just a single name-token (Knuth has a single token, Brinch Hansen has two), we take the first three letters of the last name. The boolean et.al.char.used tells whether we've used a superscripted +, so that we know whether to include a LaTeX macro for it.

```
format.lab.names(s) ==
BEGIN
      numnames := num.names$(s)
      if numnames > 1 then
          if numnames > 4 then
              namesleft := 3
          else
              namesleft := numnames
          nameptr := 1
          nameresult := ""
          while namesleft > 0
            do
              if (name_ptr = numnames) and
                   format.name\$(s, nameptr, "\{ff \}\{vv \}\{ll\}\{ jj\}") = "others"
                 then nameresult := nameresult * "{\etalchar{+}}"
                       et.al.char.used := true
```

```
else nameresult := nameresult *
                             format.name$(s, nameptr, "{v{}}{l{}}")
             nameptr := nameptr + 1
             namesleft := namesleft - 1
           od
         if numnames > 4 then
             nameresult := nameresult * "{\etalchar{+}}"
             et.al.char.used := true
     else
         t := format.name$(s, 1, "{v{}}{l{}}")
         if text.length$(t) < 2 then % there's just one name-token</pre>
             nameresult := text.prefix$(format.name$(s,1,"{ll}"),3)
         else
             nameresult := t
         fi
     return nameresult
FND
```

Exactly what fields we look at in constructing the primary part of the label depends on the entry type; this selectivity (as opposed to, say, always looking at author, then editor, then key) helps ensure that ignored fields, as described in the LaTeX book, really are ignored. Note that MISC is part of the deepest 'else' clause in the nested part of calc.label; thus, any unrecognized entry type in the database is handled correctly.

There is one auxiliary function for each of the four different sequences of fields we use. The first of these functions looks at the author field, and then, if necessary, the key field. The other three functions, which might look at two fields and the key field, are similar, except that the key field takes precedence over the organization field (for labels—not for sorting).

The calc.label function calculates the preliminary label of an entry, which is formed by taking three letters of information from the author or editor or key or organization field (depending on the entry type and on what's empty, but ignoring a leading The in the organization), and appending the last two characters (digits) of the year. It is an error if the appropriate fields among author, editor, organization, and key are missing, and we use the first three letters of the cite\$ in desperation when this happens. The resulting label has the year part, but not the name part, purify\$ed (purify\$ing the year allows some sorting shenanigans by the user).

This function also calculates the version of the label to be used in sorting.

The final label may need a trailing 'a', 'b', etc., to distinguish it from otherwise identical labels, but we can't calculated those extralabels until after sorting.

```
calc.label ==
BEGIN
```

```
2644 FUNCTION {format.lab.name}
2645 { "{vv~}{ll}{, jj}{, ff}" format.name$ 't :=
     t "others" =
        { citation.et.al }
2647
        { t get.str.lang 'name.lang :=
2648
          name.lang lang.zh = name.lang lang.ja = or
2649
            { t #1 "{ll}{ff}" format.name$ }
            { t #1 "{vv~}{ll}" format.name$ }
          if$
       }
2653
     if$
2654
2655 }
2656
```

第一作者姓名相同、年份相同但作者数量不同时,也需要年份标签区分。比如 "王临惠 等, 2010a"和"王临惠, 2010b",所以使用 short.label 存储不带"et al"的版本。

```
2657 FUNCTION {format.lab.names}

B.8 Sorting

When sorting, we compute the sortkey by executing presort on each entry. The presort key contains a number of sortifyed strings, concatenated with multiple blanks between them. This makes things like brinch per come before brinch hansen per.

The fields used here are: the sort.label for alphabetic labels (as set by calc.label), followed by the author names (or editor names or organization (with a leading The removed) or key field, depending on entry type and on what's empty), followed by year, followed by the first bit of the title (chopping off a leading The , A , or An). Names are formatted: Von Last First Junior. The names within a part will be separated by a single blank (such as brinch hansen), two will separate the name parts themselves (except the von and last), three will separate the names, four will separate the names from year (and from label, if alphabetic), and four will separate year from title.

The sort.format.names function takes an argument that should be in BibTeX name format, and returns a string containing -separated names in the format described above. The function is almost the same as format.names.

```
2800 (*author-vear)
2801 FUNCTION {sort.language.label}
2802 { entry.lang lang.zh =
        { lang.zh.order }
        { entry.lang lang.ja =
2804
            { lang.ja.order }
2805
            { entry.lang lang.en =
2806
                 { lang.en.order }
2807
                 { entry.lang lang.ru =
2808
                     { lang.ru.order }
2809
                     { lang.other.order }
                   if$
2812
```

```
if$

2994 }
2995
```

Now comes the final computation for alphabetic labels, putting in the 'a's and 'b's and so forth if required. This involves two passes: a forward pass to put in the 'b's, 'c's and so on, and a backwards pass to put in the 'a's (we don't want to put in 'a's unless we know there are 'b's). We have to keep track of the longest (in width\$ terms) label, for use by the thebibliography environment.

```
VAR: longest.label, last.sort.label, next.extra: string
    longest.label.width, last.extra.num: integer

initialize.longest.label ==
BEGIN
    longest.label := ""
    last.sort.label := int.to.chr$(0)

```

B.9 Write bbl file

Now we're ready to start writing the .BBL file. We begin, if necessary, with a LATEX macro for unnamed names in an alphabetic label; next comes stuff from the 'preamble' command in the database files. Then we give an incantation containing the command \begin{thebibliography}{...} where the '...' is the longest label.

We also call init.state.consts, for use by the output routines.

```
3063 FUNCTION {begin.bib}
3064 { preamble$ empty$
3065 'skip$
3066 { preamble$ write$ newline$ }
```

```
3067
     "\begin{thebibliography}{" number.label int.to.str$ * "}" *
3068
     write$ newline$
3069
      terms.in.macro
3070
        { "\providecommand{\biband}{和}"
3071
3072
          write$ newline$
          "\providecommand{bibetal}{$}"
3073
          write$ newline$
3074
       }
3075
        'skip$
3076
      if$
3077
      "\providecommand{\natexlab}[1]{#1}"
      write$ newline$
      "\providecommand{\url}[1]{#1}"
     write$ newline$
3081
     "\expandafter\ifx\csname urlstyle\endcsname\relax\else"
3082
     write$ newline$
3083
     " \urlstyle{same}\fi"
3084
     write$ newline$
     "\expandafter\ifx\csname href\endcsname\relax"
     write$ newline$
3087
     " \DeclareUrlCommand\doi{\urlstyle{rm}}"
3088
     write$ newline$
3089
     " \def\eprint#1#2{#2}"
3090
         write$ newline$
      "\else"
3092
     write$ newline$
3093
      " \def\doi#1{\href{https://doi.org/#1}{\nolinkurl{#1}}}"
3094
     write$ newline$
3095
        \let\eprint\href"
3096
          write$ newline$
3097
      "\fi"
3099
         write$ newline$
3100
3101
     Finally, we finish up by writing the '\end{thebibliography}' command.
3102 FUNCTION {end.bib}
3103 { newline$
      "\end{thebibliography}" write$ newline$
3104
3105 }
3106
```

B.10 Main execution

Now we read in the .BIB entries.

```
3107 READ
3108
3109 EXECUTE {init.state.consts}
3110
3111 EXECUTE {load.config}
3112
3113 (*numerical)
3114 EXECUTE {init.seq}
```

```
3116 ⟨/numerical⟩
3117 ITERATE {presort}
3118
     And now we can sort
3119 SORT
3120
3121 EXECUTE {initialize.longest.label}
3122
3123 ITERATE {forward.pass}
3124
3125 REVERSE {reverse.pass}
3127 ITERATE {bib.sort.order}
3128
3129 SORT
3130
3131 EXECUTE {begin.bib}
3132
     Now we produce the output for all the entries
3133 ITERATE {call.type$}
3134
3135 EXECUTE {end.bib}
_{3136} \langle /author-year | numerical \rangle
```
